

HIV

HIV is a virus, which attacks the immune system, making it less and less effective. HIV can eventually lead to Advanced HIV (AIDS). Everybody needs to know how HIV can be passed on, and how they can help protect themselves from being infected. HIV is transmitted by blood, semen (cum, sperm, spunk), vaginal fluids passing from one person into the body of another, or if you share injecting equipment. Although lesbians are statistically at a lower risk of being infected with HIV, this does not mean they have no risk of being infected.
